Heritage Management for Aggregate Producers

Well drained landscapes are idea locations for heritage sites and often ideal sources of aggregate. Managing heritage resources can be a challenge for aggregate producers, and can lead to delays and cost increases in proposed developments. Western Heritage have tailored our solutions to the needs of our aggregate clients, to ensure timely assessments and effective budgets. We achieve this by working with the regulators and our clients to obtain heritage clearance as efficiently as possible.

Increases in project costs and delays during project development can result if uncertainties exist regarding the presence, absence, or value of an historic resource. Western Heritage reduces these uncertainties and ensures due diligence by:

- Completing thorough research of the project area including geological maps, topography, historic site searches, and heritage reports before we head to the field
- Applying survey and testing methods that adhere to regulatory and industry standards
- Deploying a team knowledgeable in heritage resource management, geology and landscape formation processes
- working closely with the client and the regulator at all stages of an assessment

By reducing uncertainty during the assessment stage, Western Heritage provides increased confidence during the planning and budgeting phases of the development.

Contact Western Heritage for any developments that require heritage assesments.

Western Heritage also provides satellite imagery for planning and monitoring your developments. As a certified DigitalGlobe partner, we can find the best possible imagery for your application.
